Estimated 300 nesting pairs from visual estimates, applied 2016 ratio of 94:6 ARTE:COTE
 A tern census was not conducted this year, but it is estimated that there were up to 175 attempted nests island-wide, with a probable species distribution of 94% ARTE and 6% COTE - similar to last year.

Data reported for Machias Seal is reported as total count (90); species not separated. Species ratio of 96% ARTE and 4% COTE applied. Count spans entire season. Number of nests during census window not reported

no census conducted, estimate of 300-500 birds on island; reported 50 nests from visual estimation w/ 96% ARTE and 4% COTE species ratio, lower than previous 2 years.

300-500 birds on island, reported 75 nests from visual estimation with 96% ARTE and 4% COTE species ratio; 33 nests found in marked plots,

300-500 birds on island, reported 175 nests with 96% ARTE and 4% COTE species ratio; 94 nests found in marked plots

35 nests found in marked plots, used 96% ARTE and 4% COTE species ratio

74 nests found in marked plots, used 96% ARTE and 4% COTE species ratio

Methods: N=nest count, NE=partial nest count & extrapolation NP=nesting pairs (visual estimate), VE=individual birds (visual estimate from island), VEB=individual birds (estimate from boat)

Productivity Methods: 1=feeding study, 2=fenced plot, 3=unfenced plot

Note: Productivity is expressed as the number of fledglings/nest, N=sample size, SD=standard deviation, 15-day old COTE and ARTE chicks are considered fledglings, study chicks found dead after fledge date are subtracted from productivity estimate. ROST chicks were considered fledged based on survival to 10 days and weights during the first few days of life.
